Channel Margin Architecture: Dine-In, Delivery and Take-Away with a Separate P&L

Method proven in 8,400+ restaurants · 43 countries

masterrestaurant.com

QUICK VERDICT

Verdict: a single consolidated P&L hides that delivery typically runs 12-20 margin points below dine-in once commissions, packaging and logistics shrinkage are loaded in. The right architecture is a managerial P&L separated by channel, with theoretical vs. actual cost per channel, its own prime cost and its own break-even. Without separate accounting, the group leader isn't running three businesses: they're subsidizing the worst with the best and don't know it. With a recommended prime cost of 55-65% of sales (Toast) and aggregator commissions eroding every order, channel separation stops being an accounting luxury and becomes the only way to know which channel creates EBITDA and which destroys it.

INTELLECTUAL PROPERTY OF MASTERRESTAURANT® — EXCLUSIVE FOR SECTOR LEADERS

This white paper targets CFOs, expansion directors and multi-unit restaurant group leaders running three or more sales channels under one brand. The core problem: the consolidated P&L averages and hides. When dine-in, delivery and take-away share kitchen, labor and inventory but carry radically different cost structures, a 'healthy' blended margin can conceal a channel burning cash on every ticket.

The Masterrestaurant framework starts from an operating thesis: each channel is an independent unit economics. Dine-in sells experience and table turns; delivery sells convenience with a silent commission baked in; take-away sells speed with almost zero service cost. Treating them as one business is a bookkeeping architecture error that costs EBITDA points every month.

This document delivers the theoretical framework, the formulas, the technical architecture of the channel-separated P&L, and a 90-day roadmap so a restaurant group stops flying blind and starts deciding channel mix, pricing and investment with real per-channel data.

SIDE-BY-SIDE COMPARISON

Side-by-side comparison

	CONSOLIDATED P&L (TRADITIONAL APPROACH)	CHANNEL-SEPARATED P&L (MASTERRESTAURANT ARCHITECTURE)
Visibility of true margin per channel	✗ None: a single blended margin hides a 12-20 pt dine-in vs. delivery gap	✓ Full: contribution margin computed per channel, ticket by ticket
Treatment of aggregator commissions	✗ Diluted in 'other expenses'; the order looks profitable	✓ Loaded 100% onto delivery; the order shows its real margin
Prime cost (food + labor)	✗ A single one, 55-65% target (Toast) on the total, no breakdown	✓ Own prime cost per channel; delivery often exceeds 65% once logistics load in
Break-even point	✗ One for the whole operation	✓ Break-even per channel: how many orders each covers its structure
Pricing and menu engineering decision	✗ Single price per dish across all channels	✓ Menu engineering per channel: delivery price tuned to its service cost
Theoretical vs. actual cost	✗ Global variance averaging leaks from all channels	✓ Variance per channel: isolates delivery packaging and logistics shrinkage
Ability to allocate CapEx/OpEx per channel	✗ You invest 'in the restaurant', without knowing which channel needs it	✓ Investment assigned to the channel that generates and pays for it

Chapter 1 — Why your consolidated P&L is lying to you

A consolidated P&L averages and hides: when dine-in, delivery, and take-away share the same kitchen, payroll, and inventory yet carry radically different cost structures, a blended margin that looks healthy can conceal a channel that burns cash on every ticket. Delivery typically runs 12 to 20 margin points below dine-in once com-

mission, packaging, and logistics shrinkage are loaded in. One figure frames the stakes: the industry prime-cost target sits below 60-65% of sales per Toast, but that single benchmark can't tell that delivery clears it easily while take-away lands under it. Diego F. Parra puts it plainly at Masterrestaurant: a single P&L answers 'is the restaurant profitable?', but it never answers the question that costs money, 'which of my three businesses is losing me cash?'. The aggregator commission is the cost a consolidated P&L dissolves into 'other expenses' and that a per-channel P&L charges fully to delivery.

Chapter 2 — The silent commission the consolidated view dissolves

When that commission —usually 15% to 30% of the ticket— is booked where it originates, the same plate that leaves a healthy margin in dine-in shows 12 to 20 points less in delivery. Input costs make it worse: 80-90% ground beef reached \$5.63 per pound in mid-2026 versus \$4.56 in 2025 per USDA, and arabica coffee hit a record \$4.41 per pound in February 2025 per Bellwether Coffee. With food cost under pressure, every point the commission steals from delivery matters more. I've watched groups celebrate a 'growing' delivery channel that was really subsidizing each order with the dining room's margin. Take-away is the channel with the highest potential contribution margin of the three, because it pays no table service and no aggregator commission, and the consolidated P&L buries it under the average. With no server depending on tips —which represent 58.5% of front-of-house hourly income in the U.S.

Chapter 3 — Take-away: the most misunderstood of the three channels

per Clockify— and no commission cutting 15-30 points, its service cost is nearly zero. In limited service, median prime cost was 65 cents per dollar of sales in 2024 per the National Restaurant Association, yet take-away can land below that when packaging is minimal. The mistake I see over and over: groups pushing costly delivery while ignoring a take-away that already banks more cash. A separated P&L turns that hunch into a number that steers investment and focus. A managerial per-channel P&L demands theoretical versus actual cost on every line, because the gap between them is where the leak lives. Theoretical cost is what the recipe says it should cost; actual is what left the register. An average restaurant wastes between 4% and 10% of what it buys per The Restaurant HQ, and full-service foodservice concentrated more than 43% of the sector's total surplus per ReFED 2024.

Chapter 4 — Theoretical vs. actual cost: where the leak hides

That shrinkage isn't split evenly across channels: delivery logistics add packaging and discards that take-away doesn't carry. If you measure food-cost variance only on the consolidated view, you average the costly channel's waste with the cheap one's efficiency and act on neither. Splitting theoretical from actual per channel tells you exactly which line of which business is bleeding. Each channel is an independent unit economics, and treating them as one business is a contable architecture error that costs EBITDA points every month. Dine-in sells experience and table turnover; delivery sells convenience with an embedded commission; take-away sells speed with near-zero service cost. The pricing backdrop makes it urgent: U.S. restaurant inflation hit 8.8% in March 2023, the highest in over two decades per the National Restaurant Association, and the historical average for food away from home runs around 3.5% annually per USDA.

Chapter 5 — Independent unit economics per channel

With those headwinds, you can't afford a channel quietly draining margin. The Masterrestaurant framework starts from this thesis: you model three P&Ls, each with its own food cost, service cost, and commission, and you decide with data, not averages. Implementation takes 90 days and starts by instrumenting the data: tagging every sale by channel in the POS, charging commissions to delivery, and splitting packaging as its own line. Weeks 1-4: map shared costs —kitchen, payroll, inventory— and define the per-channel allocation rule. Weeks 5-8: build the three P&Ls with theoretical versus actual cost and measure the variance. Weeks 9-12: decide channel mix, differentiated pricing, and which channel earns investment. The size of the bet isn't small: the median sale price of a small U.S. restaurant reached \$773,000 in 2025, up 24% from 2021 per BizBuySell, and that value rests on defensible per-channel margins.

Chapter 6 — A 90-day roadmap to separate the P&L

Diego F. Parra insists at Masterrestaurant: the goal isn't a pretty report, it's to stop flying blind and start deciding with one number per business. Differentiated pricing per channel is the lever that recovers the 12-20 points delivery loses against dine-in, and only a separated P&L tells you how much to raise without scaring off demand. If the aggregator commission takes 15-30 points, the delivery menu price must absorb that load or the margin evaporates. Input pressure confirms it: farm-level egg prices rose 43.1% in 2024 per USDA and retail egg prices added another 21.9% in 2025. With costs like those, holding the same price across all three channels gives away margin on the costliest one. Take-away, with its near-zero service cost, tolerates a more aggressive price and captures price-sensitive demand. Separated accounting turns pricing from an act of faith into a decision made with food cost, commission, and service cost in full view, channel by channel.

Chapter 7 — The differences that define the margin

The consolidated P&L answers 'is the restaurant profitable?'; the per-channel P&L answers 'which of my three businesses is costing me money?'. Different questions, and only the second lets you act. In the consolidated view, the aggregator commission vanishes into expenses; in the separated one, it loads fully onto delivery and reveals that ticket can carry 12-20 fewer margin points than the same dish in the dining room. The consolidated uses one prime cost with a 55-65% target (Toast); the separated recognizes delivery, with packaging and logistics, often exceeds 65% while take-away can sit below thanks to its near-zero service cost. Take-away is the most misunderstood channel: with no table service and no commission, its contribution margin can be the highest of the three, but the consolidated P&L never shows it and operators underinvest in it.

POINT BY POINT

Comparative analysis: consolidated vs. channel-separated

VISIBILITY OF TRUE MARGIN

A · CONSOLIDATED P&L (TRADITIONAL APPROACH)

The consolidated shows a single margin that averages and hides the channel gap

B · MASTERRESTAURANT The separated

reveals each channel's contribution margin, ticket by ticket

Verdict: Only the per-channel P&L lets you decide; the consolidated informs but isn't actionable at channel level

AGGREGATOR COMMISSIONS

A · CONSOLIDATED P&L (TRADITIONAL APPROACH)

Diluted in general expenses; the delivery order looks healthy

B · MASTERRESTAURANT Loaded in full

onto delivery; the order shows its real eroded margin

Verdict: Separation is the only way to see the silent commission bleeding the delivery margin

PRICING AND MENU ENGINEERING

A · CONSOLIDATED P&L (TRADITIONAL APPROACH)

Single price per dish across the three channels

B · MASTERRESTAURANT Price tuned to

each channel's service cost

Verdict: A single price subsidizes delivery with dine-in; per-channel pricing protects all three margins

INVESTMENT DECISION (CAPEX/OPEX)

A · CONSOLIDATED P&L (TRADITIONAL APPROACH)

You invest 'in the restaurant' without knowing which channel needs it

B · MASTERESTAURANT Investment is assigned to the channel that generates and pays for it

Verdict: The per-channel P&L avoids overinvesting in a margin-destroying channel and underinvesting in the one that creates it

SIDE-BY-SIDE COMPARISON

Consolidated P&L TRADITIONAL APPROACH

- ✗ A single blended margin for the whole operation
- ✗ Aggregator commissions diluted in general expenses
- ✗ Single prime cost with no per-channel breakdown
- ✗ Identical price per dish across dine-in, delivery and take-away
- ✗ Impossible to know which channel creates or destroys EBITDA

Channel-Separated P&L MASTERESTAURANT

- ✓ Contribution margin computed channel by channel
- ✓ Commissions loaded 100% onto the channel that generates them
- ✓ Own prime cost, break-even and variance per channel
- ✓ Menu engineering and pricing tuned to each channel's service cost
- ✓ Mix, investment and channel-closure decisions with real data

SIDE-BY-SIDE COMPARISON

REAL CASE

“A three-brand group showed me a consolidated P&L with 11% EBITDA and they were thrilled. We separated the channels and delivery, which was 34% of sales, was running a negative contribution margin after commission, packaging and shrinkage. Dine-in was subsidizing delivery and no one knew it. We renegotiated the commission, raised delivery prices 9% and cut six dishes that didn't travel well. Three months later consolidated EBITDA rose to 15% without selling a single dollar more: we simply stopped bleeding through a channel we thought was the winner.”

— Diego F. Parra, Masterrestaurant

HOW TO APPLY IT IN YOUR RESTAURANT

90-day implementation roadmap

- 1 Days 1-30: separate revenue and isolate direct cost per channel**
Tag every POS transaction by channel (dine-in, delivery, take-away). Pull aggregator commissions out of 'other expenses' and load them 100% onto delivery. Assign disposable packaging to delivery and take-away. Using the recommended 55-65% of sales prime cost (Toast, 2025) as a reference, compute each channel's real prime cost separately. By month-end 1 you should have three revenue columns with their direct food cost.
- 2 Days 31-60: allocate semi-variable costs and build contribution margin per channel**
Distribute kitchen labor by each channel's time-and-activity, not evenly. Assign dine-in service cost to dine-in only. Compute each channel's contribution margin: price – direct cost – commission – packaging. This is where delivery usually emerges 12-20 points below dine-in. Document the theoretical vs. actual cost variance per channel to isolate where the margin leaks.
- 3 Days 61-90: decide mix, pricing and menu engineering per channel**
With per-channel margin in hand, apply differentiated menu engineering: delivery price tuned to its service cost, pull dishes that don't travel (go cold, lose texture, generate complaints). Recompute each channel's break-even. Decide investment: take-away, with near-zero service cost, usually deserves more capacity. Define tracking KPIs at 3, 6 and 12 months for the board.
- 4 Ongoing governance: a managerial P&L per channel at every close**
Institutionalize the monthly close with three parallel P&Ls plus one consolidated. Review prime cost, contribution margin and break-even per channel at every leadership meeting. The discipline of reading margin by channel, not the average, is what separates a group that scales profitably from one that grows while losing money on a channel it believes is a winner.

FAQ

Frequently asked questions

Why does delivery look profitable in the consolidated P&L but isn't per channel?

Because the consolidated view dilutes the aggregator commission across general expenses. Loading it 100% onto delivery, that channel's real contribution margin usually drops 12-20 points versus dine-in. The dish is the same; the cost of serving it via delivery is not.

Should I charge the same price for dine-in, delivery and take-away?

Not necessarily. Per-channel menu engineering tunes price to each channel's service cost. Delivery carries commission, packaging and logistics shrinkage, so an identical price erodes its margin. Take-away, with near-zero service cost, can sustain higher price and margin.

What is the target prime cost per channel?

The industry reference is 55-65% of sales for food + labor, with a healthy target ≤60% (Toast, 2025). But each channel has its own: delivery often exceeds 65% once logistics and packaging load in, while take-away can sit below thanks to its low service cost.

Is separate accounting worth it if my group is small?

Yes. The smaller the group, the less cushion to subsidize a losing channel. Separation doesn't require an expensive ERP: start by tagging the POS by channel and isolating commissions and packaging. In 90 days you have three P&Ls revealing which channel creates EBITDA.
